4.3 Indication of immediate medical attention and special treatment needed, if necessary

Immediate first aid: Ensure that adequate decontamination has been carried out. If patient is not breathing, start artificial respiration, preferably with a demand valve resuscitator, bag-valve-mask device, or pocket mask, as trained. Perform CPR if necessary. Immediately flush contaminated eyes with gently flowing water. Do not induce vomiting. 12.2 Persistence and degradability

AEROBIC: Biodegradation is the ultimate fate of quaternary ammonium compounds (QACs) released to wastewater treatment and the

environment(1). Reported biodegradation measurements of QACs have varied from 0-100%, but some reported values may not distinguish between actual biodegradation, sorption and complexation mechanisms(1). One reported MITI test determined tetradecylbenzyldimethylammonium chloride degradation to be 83% after 10 days(2), but the same source reported only 0-5% degradation for the similar hexadecyl- and octadecyl-dimethylammonium chlorides(2). A decyl-, dodecyl- and tetradecylbenzyldimethylammonium chloride mixture, present at 100 mg/L, reached 0% of its theoretical BOD in 4 weeks using an activated sludge inoculum at 30 mg/L and the Japanese MITI test(3). Greater than 70% removal of 20 mg/L tetradecylbenzyldimethylammonium chloride was observed using a continuous-flow activated sludge system in a wastewater treatment plant(1). Acclimation may be a major factor that influences biodegradation of QACs(1).

12.3 Bioaccumulative potential

BCF ranges of <0.2-5.9 at 0.5 mg/L and <1.8-8.6 at 0.05 mg/L were measured in fish for a decyl-, dodecyl- and tetradecylbenzyldimethylammonium chloride mixture(1) using carp (Cyprinus carpio) which were exposed over a 6-week period(1). According to a classification scheme(2), these BCF ranges suggest the potential for bioconcentration in aquatic organisms is low(SRC).

12.4 Mobility in soil

Using a structure estimation method based on molecular connectivity indices(1), the Koc for tetradecylbenzyldimethylammonium chloride can be estimated to be 9X10+5(SRC). According to a classification scheme(2), this estimated Koc value suggests that tetradecylbenzyldimethylammonium chloride is expected to be immobile in soil.

12.5 Other adverse effects

no data available

SECTION 13: Disposal considerations

13.1 Disposal methods

Product

The material can be disposed of by removal to a licensed chemical destruction plant or by controlled incineration with flue gas scrubbing. Do not contaminate water, foodstuffs, feed or seed by storage or disposal. Do not discharge to sewer systems.

Contaminated packaging

Containers can be triply rinsed (or equivalent) and offered for recycling or reconditioning. Alternatively, the packaging can be punctured to make it unusable for other purposes and then be disposed of in a sanitary landfill. Controlled incineration with flue gas scrubbing is possible for combustible packaging materials.
